A triumphantly successful milestone for modern psychology.

By Lance Hetzler

Professor Buss has taken upon himself the formidable challenge of producing the first evolutionary psychology textbook, a milestone that is long overdue. In his endeavor he has succeeded magnificently. In 411 pages he manages a sterling job of covering the most important topics in evolutionary psychology, bringing to bear the most up to date literature in a simple to read yet academically compelling format. He begins with a complete and intelligent introduction to both evolutionary theory and the events leading to the development of an evolutionary psychology. Thereafter, he covers broad branches of human behavior - kin relations, cooperative relationships, warfare, aggression, status-seeking, parenting and, of course, human mating strategies. This last topic is covered in several different chapters and highlights the author's own valuable, ground-breaking work done in the area. His book provides a miraculous combination of both utterly fascinating and effortless reading, rare qualities in textbooks. No review can be complete without mention of a few blemishes, however minor and in this case it is particularly tempting to simply omit them entirely. However, Dr. Buss occasionally relies heavily, too heavily perhaps, on secondary or general sources of information (i.e., Dawkins, de Waal, Pinker) when more research oriented sources are available. No doubt this stems, at least in part, from the fact that there is simply not as much primary literature on the subject as one could hope for (at least where humans are concerned). This will undoubtedly be improved by the time the next edition rolls off the press. Too, one would greatly hope that future editions of this text might include a section on foraging/hunting and food adaptations since they are so fundamental to survival and because so many other primate species display overt and well-studied feeding adaptations. However, such minor details are utterly dwarfed by the magnitude, importance and quality of this work. The breadth, depth and timeliness of this textbook cannot be overstated. If you are planning on teaching an undergraduate course on evolutionary psychology or are simply interested in learning more about the subject, this is, without question, the most authoritative and comprehensive vehicle available, eclipsing even the extraordinary *Adapted Mind*.

This is an excellent textbook for undergraduate students.

By A Customer

By working from the premises of Tooby & Cosmides' Integrated Causal Model, David Buss has done an outstanding job of making accessible not only the complex historical development of evolutionary psychology, but also inclusive fitness theory, specific evolutionary hypotheses and specific predictions derived from these hypotheses. Furthermore, Buss is comprehensive, balanced and precise when asserting theories and empirical substantiation from other major thinkers, viz., Trivers, Pinker, Bloom, Ridley, Symons, Williams, Mayr, Plomin, DeFries, etc.

A Great Introduction to Evolutionary Psychology

By Robert H. Pietrzak

In "Evolutionary Psychology -- The New Science of Mind," David M. Buss delivers a comprehensive, well-detailed, and illustrative presentation of evolved psychological mechanisms that have become universal across the human species while detailing the biology necessary to understand evolutionary theory and how it applies to human psychology. Organizationally-sound, the textbook reads like a novel, clearly providing

theoretical and empirical information requisite for a fundamental understanding of Evolutionary Psychology. Buss' volume is essential reading for students of Evolutionary Psychology and very suitable reading for those of us interested in why we are the way we are. For more advanced readers, "The Adapted Mind," edited by Barkow, Cosmides, and Tooby is an ideal choice.
